Functional analysis provides a concise conceptual framework for linear control theory. This autonomous text, aimed at engineering students, demonstrates the unity of the subject. It has a wide range of powerful theorems illustrating the internal spaces of the product, instability, controllability and observability. It also analyzes the minimum standard and time control, as well as distributed systems. The first chapter provides a brief survey of basic mathematics, followed by chapters containing most of the math needed later in the book. Later chapters establish axioms for linear dynamic systems, linking the axiomatic description to the state space description. They also consider important structural properties of a given system, the formulation of optimization problems, issues of existence and uniqueness, and the characterization of optimal controls. The final chapter returns to some of the concepts and methods discussed above, extending applications from finite dimensional systems to distributed parameter systems. A comprehensive set of references concludes the text. PAGE 1 PAGE 2 Add to Wishlist Functional analysis provides a concise

conceptual framework for linear control theory. This autonomous text, aimed at engineering students, demonstrates the unity of the subject. It has a wide range of powerful theorems illustrating the internal spaces of the product, instability, controllability and observability. It also analyzes the minimum standard and time control, as well as distributed systems. The first chapter provides a brief survey of basic mathematics, followed by chapters containing most of the math needed later in the book. Later chapters establish axioms for linear dynamic systems, linking the axiomatic description to the state space description. They also consider important structural properties of a given system, the formulation of optimization problems, issues of existence and uniqueness, and the characterization of optimal controls. The final chapter returns to some of the concepts and methods discussed above, extending applications from finite dimensional systems to distributed parameter systems. A comprehensive set of references concludes the text. Reprint of the Academic Press, London, 1980 edition. LeighPage Count176Dimensions5 3/8 x 8 1/2 Product Review Central London Polytechnic About your problems from the right It's not that you can't see the solution. finish and start with the answers. So, they just can't see the problem. one day, you might find G.K. Chesterton's last question, The of F. you brown 'The Point of a Pin'. 'The Hermit Dressed in Crane Feathers' in The Murders of the Chinese Maze of R. Van Gulik. The growing specialization and diversification have brought a series of mono graphics and textbooks on increasingly specialized topics. However, the tree of knowledge of mathematics and it doesn't just grow by presenting new branches. It also happens, quite often, that branches that were thought to be completely disparate are suddenly related. In addition, the type and level of sophistication of mathematics applied in various sciences has changed dramatically in recent years: measurement theory is used (not trivially) in regional and theoretical economics; algebraic geometry interacts with physics; the Minkowsky lemma, cod theory and water structure lie with each other in packaging theory and coverage; quantum fields, crystal defects and the mathematical benefit of the grammingity of homoopia theory; Lie algebras are relevant for filtering; and electrical prediction and engineering can use Stein spaces.
